## Features

- Solid-State
- High speed
- Ultra-high reliability
- Low insertion loss
- Compact

## Applications

- Optical protection
- Configurable operation
- Instrumentation

The NanoSpeed™ Premium Variable Fiber Optical Attenuator (NPOA) provides electrical control of optical power. This is achieved using a patent pending non-mechanical configuration and activated via a voltage electrical control signal. The solid-state optical crystal design eliminates mechanical movement and organic materials. The NP Series Variable Optical Attenuators are designed to meet the most demanding operation requirements of ultra-high reliability and fast response time with minimal mechanical footprint. Agiltron also offers customized electronic designs to meet special control requirements and applications. The NPOA is bidirectional. The NP Series VOA is available in either normally-transparent in which the light passing through without the applying a voltage or normally-opaque in which the light is blocked without the applying of a voltage. The attenuation level is related to the stage. The response speed is related to the attenuation level and driver power (repetition rate). Small attenuation can reach MHz response.

The NP Series VOA is mounted on a specially designed electronic driving PCB board with a 0~5V control input and having performance optimized for various repetition rate.

## Specifications

Parameter	Min	Typical	Max	Unit
Central wavelength <sup>[1]</sup>	630		2000	nm
Insertion Loss <sup>[2]</sup>		1.5	1.8	dB
Attenuation <sup>[3]</sup>	15	20		dB
IL Temperature Dependency		0.25	0.5	dB
Return Loss	20	25		dB
Response Time (Rise, Fall)			300	ns
Fiber Type	50/125, 62.5/125, or equivalent			
Driver Repeat Rate	10kHz driver	DC	10	kHz
	100kHz driver	DC	100	
Optic power handling <sup>[4]</sup>		0.5	20	W
Operating Temperature	-5		70	°C
Storage Temperature	-40		85	°C

### Notes:

[1]. Operation bandwidth is  $\pm 25\text{nm}$  approximately at 1550nm.

Wavelength shorter than 850nm may be with a long lead time.

[2]. Measured without connector under source with CPR  $\leq 13\text{dB}$

[3]. It is measured at 5kHz under light source with CPR  $\leq 13\text{dB}$ , which may be degraded at the high repeat rate and higher CPR.

[4]. The handling power must be identified in P/N at the normal ( $\leq 0.5\text{W}$ ) or high power ( $\geq 1\text{W}$ ) when the PO is placed.

**Warning:** The device mounted on the PCB is an OEM module designed for system integration only, not for general uses. Do not touch the PCB by hand. The electrical static can kill the chips even without a power plug-in, and unpleasant electrical shock may also be felt. For laboratory use, please buy a protected Turnkey system.

### Ordering Information

Prefix	Type	Wavelength <sup>[3]</sup>	Configuration	Package	Fiber Type	Fiber Cover	Fiber Length	Connector
<b>NMOA</b> - <sup>[1]</sup>	Standard Power = 22	1060nm = 1	Transparent = 1	Standard <sup>[4]</sup> = 1	50/125 = 5	Bare fiber = 1	0.25m = 1	None = 1
<b>NHMA</b> - <sup>[2]</sup>	5W Power = 33	1310nm = 3	Opaque = 2	Hi Power <sup>[5]</sup> = 2	62.5/125 = 6	900um loose tube = 3	0.5m = 2	FC/PC = 2
	10W Power = 10	1550nm = 5	Special = 0	Special = 0	Special = 0	Special = 0	1.0 m = 3	FC/APC = 3
	20W Power = 20	780nm = 7					Special = 0	SC/PC = 4
		850nm = 8						SC/APC = 5
		660 = 6						ST/PC = 6
		Special = 0						LC/PC = 7
								Duplex LC/PC = 8
								LC/APC = 9
								LC/UPC = U
								Special = 0

[1]. **NMOA** – NS Normal Power MMF Optical Attenuator

[2]. **NHMA** – NS High power MMF Optical Attenuator

[3]. The wavelength shorter than 850nm can be produced in the special version with a long lead time.

[4]. for optical power ≤ 500mW

[5]. for optical power ≥ 1W

**NOTE:**

“transparent” means no attenuation without applying a controlling voltage, the “opaque” means the highest attenuation without applying a controlling voltage.

### Application Notes

#### Fiber Core Alignment

Note that the minimum attenuation for these devices depends on excellent core-to-core alignment when the connectors are mated. This is crucial for shorter wavelengths with smaller fiber core diameters that can increase the loss of many decibels above the specification if they are not perfectly aligned. Different vendors' connectors may not mate well with each other, especially for angled APC.

#### Fiber Cleanliness

Fibers with smaller core diameters (<5 μm) must be kept extremely clean, contamination at fiber-fiber interfaces, combined with the high optical power density, can lead to significant optical damage. This type of damage usually requires re-polishing or replacement of the connector.

#### Maximum Optical Input Power

Due to their small fiber core diameters for short wavelength and high photon energies, the damage thresholds for device is substantially reduced than the common 1550nm fiber. To avoid damage to the exposed fiber end faces and internal components, the optical input power should never exceed 20 mW for wavelengths shorter 650nm. We produce a special version to increase the handling by expanding the core side at the fiber ends.

### Q&A

---

**Q:** Does NS device drift over time and temperature?

**A:** NS devices are based on electro-optical crystal materials that can be influenced to a certain range by the environmental variations. The insertion loss of the device is only affected by the thermal expansion induced miss-alignment. For extended temperature operation, we offer special packaging to -40 ... 100 °C. The extinction or cross-talk value is affected by many EO material characters, including temperature-dependent birefringence,  $V_p$ , temperature gradient, optical power, at resonance points (electronic). However, the devices are designed to meet the minimum extinction/cross-talk stated on the spec sheets. It is important to avoid a temperature gradient along the device length.

**Q:** What is the actual applying voltage on the device?

**A:** 100 to 400V depending on the version.

**Q:** How does the device work?

**A:** NS devices are not based on Mach-Zander Interference, rather birefringence crystal's nature beam displacement, in which the crystal creates two different paths for beams with different polarization orientations.

**Q:** What is the limitation for faster operation?

**A:** NS devices have been tested to have an optical response of about 300 ps. However, practical implementation limits the response speeds. It is possible to achieve a much faster response when operated at partial extinction value. We also offer resonance devices over 20MHz with low electrical power consumption.

### Operation Manual

---

1. Connect a control signal to the SMA connector on the PCB.
2. Attach the accompanied power supply (typically a wall-pluggable unit).
3. The device should then function properly.

**Note:** Do not alter device factory settings.
