Features

- Low Loss
- High Reliability
- Compact

Applications

- Gain Control
- Power Equalizer

The CrystaLatch™ 1x5/1x6 Series LiDAR fiber optical switch is a non-mechanical device having advantageous features for LIDAR applications. It scans a probing laser beam among four output fiber ports with high power handling capability (5W CW) and redirects the reflecting light into a dedicated receiving signal fiber port. The patent pending design reduces more than 2 dB system optical loss by eliminating the need to pass the reflected signal through an additional circulator or coupler. Moreover, it provides the receiving signal with over 60dB isolation from the probe laser beam via a proprietary patent pending configuration. The all solid state CL fiber optic switch further offers extremely high reliability in addition to low insertion loss, high extinction ratio, high channel isolation, energy saving latching, and high repeatability. It is designed to meet the most demanding switching requirements of continuous operation without failure, longevity, operation under shock/vibration environment, with large temperature variations, and fast response time. The switches have been used in aerospace, out space, under sea, and outdoor applications.

Electronic driver is available for this series of switches.

The magneto-optical crystals used in the CL switches have no fatigue nor drift effect.

Specifications

Parameter	Min	Typical	Max	Unit
Operation Wavelength ^[1]	1520	1550	1580	nm
	1295	1310	1325	nm
Insertion Loss ^[2]		1.2	2.2	dB
Receive Signal Isolation ^[3]	60	65		dB
Optical Switch Speed (Rise, Fall)	5		10	μs
Repetition Rate		2K		Hz
Channel Crosstalk	26	30		dB
Optical Power Handling			5 ^[4]	W
Durability	10 ¹⁵			cycles
Operating Temperature ^[5]	-5		+70	°C
Storage Temperature	-40		+85	°C
Fiber Type	PM 1310, PM 1550, or equivalent			

Notes:

- [1]. Agiltron can achieve same SPEC at L band
- [2]. Measured without connectors. We offer 5W connectors
- [3]. Reflecting signal isolation from probing laser, for detail definition please call
- [4]. Continuous operation. For pulse operation, please call us
- [5]. Standard version -5 ~ +70°C, premium version extends the range

Note: The specifications provided are for general applications with a cost-effective approach. If you need to narrow or expand the tolerance, coverage, limit, or qualifications, please [\[click this link\]](#):

Electrical Driving Information

Each switching point is actuated by applying a polarity voltage pulse through a pair of PINS, and latched after pulse removed.

Parameter	Minimum	Typical	Maximum	Unit
Resistance (each group)	15	18	22	Ω
Switch Voltage	2.25	2.5	2.75 ^[1]	V
Pulse Duration	0.2	0.3	0.5	ms

[1]. Over this value will damage the device.

Electrical Driving Table

Optical Path	Pin Group 1		Pin Group 2		Pin Group 3	
	Pin 1	Pin 2	Pin 3	Pin 4	Pin 5	Pin 6
IN → P1 & P1 → R ^[1]	+ ^[2]	0	+	0	+	0
IN → P2 & P2 → R	0	+	0	+	0	+
IN → P3 & P3 → R	+	0	0	+	+	0
IN → P4 & P4 → R	0	+	+	0	+	0
IN → P5 & P5 → R	+	0	0	+	0	+
IN → P6 & P6 → R	0	+	+	0	0	+

[1]. IN: Input Port; P1: Port 1; R: Receive Port.

[2]. "+": 2.25~2.75V Pulse, Topical is 2.5V pulse

Driving kit with USB and/or RS232 or TTL interfaces is available. We provide GUI for USB and RS232 interface. Please contact sales for more information.

Note:

The driving voltage value is transient voltage with a full load. The driver circuitry needs to provide sufficient current (~300mA) during the switching. Inside the switch core is an electromagnet with a residual magnetic field. The residual magnetic field will be established when an electrical current flows in one direction through the coil for a sufficiently long period. The residual magnetic field latches the switch state even without applying a voltage (the current flow stopped). Flowing a current in the opposite direction for a sufficient time changes the switch stage by establishing a reversal magnetic field. The coil is forgiving to the driver unless one burns it by applying a higher voltage or a current for too long (day). The switch can also be operated at high repetition rates of kHz, where the residual magnetic field may not be fully established.

Fiber Core Alignment

Note that the minimum attenuation for these devices depends on excellent core-to-core alignment when the connectors are mated. This is crucial for shorter wavelengths with smaller fiber core diameters that can increase the loss of many decibels above the specification if they are not perfectly aligned. Different vendors' connectors may not mate well with each other, especially for angled APC.

Fiber Cleanliness

Fibers with smaller core diameters (<5 µm) must be kept extremely clean, contamination at fiber-fiber interfaces, combined with the high optical power density, can lead to significant optical damage. This type of damage usually requires re-polishing or replacement of the connector.

Maximum Optical Input Power

Due to their small fiber core diameters for short wavelength and high photon energies, the damage thresholds for device is substantially reduced than the common 1550nm fiber. To avoid damage to the exposed fiber end faces and internal components, the optical input power should never exceed 20 mW for wavelengths shorter 650nm. We produce a special version to increase the how handling by expanding the core side at the fiber ends.

DATASHEET

Driver Design Example for 1x4

A recommended +5VDC powered driving circuit is provided. The resistor network R1~R8 is to suppress the driving signal's voltage level to meet the "switch voltage" requirements. In specific applications, users can use lower voltage to eliminate the R1~R8. The Q1~Q8 is the control signal from either a function generator or a microcontroller general purpose I/O. The Q1~Q8 switching speed must meet the specific MOSFET switching requirement and CL 1x4 Switch specific requirement. Usually, the control signal speed is $\leq 2\text{kHz}$.

Usually, a clean power supply source will be sufficient. However, decoupling capacitors for the transistor supply rail are recommended depending on different applications. Minimum the current loop on the switching circuits will minimize the switching noise. For other layout recommendations, please refer to books or application notes from the IC manufacturer.
